

Patient Information

Gender: Male
Age: 40
Hypertension: 0
Heart Disease: 0
Smoking History: never
Bmi: 25.0
Hba1C Level: 5.5
Blood Glucose Level: 120
Bmi Category: Overweight
Age Group: 21-40

Prediction

Prediction: Low Diabetes Risk
Risk Probability: 5.00%

AI Clinical Summary

Clinical Summary

Based on the Random Forest model's prediction, this patient has a low diabetes risk, with a probability of 5.00%. This assessment is largely supported by several positive health indicators and the absence of common risk factors.

Major Risk Factors

The factors contributing to this low-risk prediction include:

- * **Normal BMI (25.0):** Within the healthy weight range.
- * **Normal HbA1c Level (5.5):** Indicative of good long-term blood sugar control.
- * **No Smoking History:** Absence of a significant lifestyle risk factor for many chronic diseases, including diabetes.
- * **No Hypertension:** Normal blood pressure further reduces cardiovascular and diabetes risk.
- * **No Heart Disease:** Absence of established cardiovascular conditions.

While the blood glucose level of 120 mg/dL is on the higher side of normal, potentially bordering on pre-diabetic depending on measurement context (e.g., fasting), the model's overall assessment places the patient in a low-risk category for diabetes.

Lifestyle Recommendations

- * **Maintain a Balanced Diet:** Focus on whole grains, lean proteins, fruits, and vegetables, limiting processed foods and added sugars.
- * **Engage in Regular Physical Activity:** Aim for at least 150 minutes of moderate-intensity exercise per week.
- * **Monitor Blood Glucose:** Continue to monitor blood glucose levels and discuss any changes with a healthcare provider.
- * **Schedule Regular Health Check-ups:** Ensure ongoing monitoring of key health markers with your primary care physician.

Important Note
