Patient Information

Gender: Male
Age: 40
Hypertension: 0
Heart Disease: 0
Smoking History: never
Bmi: 25.0
Hba1C Level: 5.5
Blood Glucose Level: 120
Bmi Category: Overweight
Age Group: 21-40

Prediction

Prediction: Low Diabetes Risk
Risk Probability: 5.00%

AI Clinical Summary

Clinical Summary

The machine learning model predicts a low diabetes risk for this patient, with a probability of 5.00%. This assessment is largely supported by several positive health indicators.

Major Risk Factors

The factors contributing to this low-risk prediction include a healthy BMI (25.0), normal HbA1c level (5.5), absence of smoking history, hypertension, and heart disease. The blood glucose level of 120 mg/dL is at the higher end of the normal range and borders on pre-diabetic criteria, though it did not elevate the overall risk prediction significantly according to the model.

Lifestyle Recommendations

1. Maintain a balanced diet rich in whole foods and low in processed sugars.
2. Engage in regular physical activity, aiming for at least 150 minutes of moderate-intensity exercise per week.
3. Continue to monitor blood glucose levels periodically as advised by a clinician.
4. Ensure adequate hydration and consistent sleep patterns for overall well-being.

Important Note

This summary is an AI-generated educational interpretation of a machine learning model's prediction and is not a medical diagnosis or substitute for professional medical advice. Always consult with a qualified healthcare provider for personalized medical guidance.
