

Patient Information

Gender: Female
Age: 30
Hypertension: 0
Heart Disease: 0
Smoking History: never
Bmi: 25.0
Hba1C Level: 5.5
Blood Glucose Level: 120
Bmi Category: Overweight
Age Group: 21-40

Prediction

Prediction: Low Diabetes Risk
Risk Probability: 4.00%

AI Clinical Summary

Clinical Summary

This patient, a 30-year-old female, has been assessed by the machine learning model as having a low diabetes risk, with a probability of 4.00%. While her blood glucose level of 120 mg/dL is within the pre-diabetic range, other favorable factors such as a normal BMI, normal HbA1c, and the absence of smoking history, hypertension, and heart disease contribute to the model's overall low-risk prediction.

Major Risk Factors

The following patient factors are considered favorable and contribute to the low diabetes risk prediction:

- * Young age (30 years)
- * Normal Body Mass Index (BMI) of 25.0
- * Normal HbA1c level of 5.5%
- * No smoking history
- * Absence of hypertension
- * Absence of heart disease

Lifestyle Recommendations

1. Maintain a balanced diet rich in whole foods, vegetables, and lean proteins, limiting processed sugars and unhealthy fats.
2. Engage in regular physical activity, aiming for at least 150 minutes of moderate-intensity exercise per week.
3. Continue to monitor and maintain a healthy weight.
4. Adhere to routine medical check-ups to monitor blood glucose and overall health indicators.

Important Note

This is an AI-generated educational summary based on provided patient data and a machine learning model's output. It is not a medical diagnosis and should not replace professional medical advice, diagnosis, or treatment. Clinicians should use their professional judgment in patient care.
