

Patient Information

Gender: Male
Age: 40
Hypertension: 0
Heart Disease: 0
Smoking History: never
Bmi: 25.0
Hba1C Level: 5.5
Blood Glucose Level: 120
Bmi Category: Overweight
Age Group: 21-40

Prediction

Prediction: Low Diabetes Risk
Risk Probability: 5.00%

AI Clinical Summary

Clinical Summary

The machine learning model predicts a very low overall risk of developing diabetes for this patient, with a probability of 5.00%. This is a favorable prediction, indicating that based on the provided data, the patient's current risk is minimal. However, it's important to note that while the overall risk is low, the blood glucose level of 120 mg/dL is slightly elevated and falls within the pre-diabetic range, warranting continued monitoring and healthy lifestyle practices.

Major Risk Factors

The following patient factors primarily contributed to the model's prediction of low diabetes risk:

- * Normal Body Mass Index (BMI 25.0)
- * Healthy HbA1c level (5.5%)
- * Absence of smoking history
- * No diagnosed hypertension
- * No history of heart disease

Lifestyle Recommendations

1. ****Balanced Nutrition:**** Continue to prioritize a diet rich in whole foods, fruits, vegetables, and lean proteins, while limiting processed foods, excessive sugars, and unhealthy fats.
2. ****Regular Physical Activity:**** Aim for at least 150 minutes of moderate-intensity aerobic exercise per week, combined with strength training a few times a week.
3. ****Maintain Healthy Weight:**** Continue efforts to maintain a healthy BMI through a balanced diet and regular exercise.
4. ****Routine Monitoring:**** Schedule regular check-ups with a healthcare provider to monitor blood glucose levels and other key health indicators.
